STATE CERTIFIED Missouri ADAPTED Hybrid Seed Corn

CERTIFIED and SEALED by Missouri Corn Growers Association
Varieties Recommended by Missouri College of Agriculture

Why Plant Mo. State Certified Seed?

So many private brands are being offered, each grower claiming this or that, it's hard to know what to believe. The varieties of hybrid corn that we are offering have been thoroughly tested by the Missouri College of Agriculture for all-round performance such as increased yields, drought, wind and disease resistance, better roots, stronger stalks, and above all adaptability. By buying Missouri State Certified Seed you can know positively that you are getting hybrids that are proven superior by your own college station.

Certified MISSOURI HYBRID No. 8

Especially for the southern $\frac{3}{4}$ of the state and from tests in extreme southeast Missouri, should do well in western Kentucky and northern Arkansas. This hybrid released for production in 1934, but no production of seed of any significance until 1938. Has been tested 5 years and shows MORE THAN 35% INCREASE OVER OPEN POLLINATED VARIETIES for the five-year period.

Has exceptionally good stalk and root system, giving excellent resistance to lodging. Mostly one-ear. Ears large and well filled, longest maturity of Missouri hybrids. Recommended by Missouri experiment station as best hybrid for Missouri. Does well on upland soils, but probably best adapted to rich bottom lands. Stalks large, medium height, ears large, and at medium height.

MISSOURI HYBRID No. 47

This hybrid is very similar to the famous Illinois 960 except that it does not grow so tall. Probably best adapted to northern half or two-thirds of Missouri. No tests in Iowa or Illinois. Five to seven days later than Illinois 960. Stands up well, somewhat large stalk.

Certified and recommended by Missouri College of Agriculture as a satisfactory Earlier Maturing Variety. Its similarity in pedigree to Illinois 960, along with good showing in 1937 yield tests placed it among the better hybrids for Missouri.

IOWA HYBRID No. 13

Adapted to northern half of Missouri and southern half of Iowa. Released for commercial production in 1934. This hybrid is of medium to less than average height, tends somewhat toward being two-eared. Stands up very well. Iowa 13 seems to be more drought and heat resistant than most hybrids, being one of the best in this respect in trials in 1934 and again in 1936. Tested in southern Iowa 7 years, shows 30% increase over open pollinated for 7-year period. Yields recorded in Iowa as high as 118.99 bushels per acre. This corn is not flint, has a good root system and abundant foliage as well as yield, making this a good hybrid for ensilage purposes.

ILLINOIS HYBRID No. 960

(Certified by the Illinois Crop Improvement Assn.)

Adapted to nearly all of Missouri, southern Iowa, northern Kentucky, southern two-thirds Illinois. Probably the most widely adapted hybrid in present production.

A hybrid of medium early maturity. Tends to two ears. Grows somewhat later than many hybrids. Has good strong stalk, although the stalk is not as large as some hybrids. Good root system, and stands up well.

In soil adaptation tests in Illinois in 1936, Illinois 960 ranked first on soils of low, medium, and high fertility, showing an adaptability to soil as well as climatic variation.

Shows 28% increase over open pollinated for 3-year average. Good resistance to drought, giving good yields in 1936.

The vines are strong and vigorous like Marglobe. The fruits are nearly round or slightly flattened, of large size, always smooth, ripen evenly and are a bright deep scarlet all the way through, extremely solid with few seeds. Topsall ripens slightly earlier than Marglobe, bears until frost and is an extra heavy yielding sort. It is resistant to both blight and rust. Here is a fine Tomato for both home and market. Pkt., 15c; 1/2 oz., 35c; oz., 50c; 1/4 lb., \$1.50, prepaid.

CULTURE. One ounce seed will produce about 2000 plants. Sow seed in March and April in the hotbed, or in pots in a sunny exposure in the house. Transplant when 2 to 3 inches high. Lime for Lawns and Gardens

This is an excellent tonic—sweetens the soil, stimulates growth, deepens color, improves quality, releases nitrogen for plant food and aids blooming. Flowers in pots, boxes or in the garden, vegetables and also fruit and ornamental trees and shrubs show marked increase in growth and beauty by a liberal application of lime. Apply about a pound to every 30 square feet surface and rake in gently. This may be done before planting or after plants are several inches high. 12-lb. bag, 25c; 50 lbs., 50c; 100 lbs., 85c. Delivered in Sedalia.

Archias' Weed Killer

KILLS NOXIOUS WEEDS AND GRASSES AND FERTILIZES
LAWNS AT ONE TREATMENT

Recent experiments with Nitrogenous Salts prove that noxious grasses and weeds such as Chick Weeds, Dandelions, and other weeds, which ruin good lawns, may be killed with ARCHIAS' WEED KILLER, which then fertilizes the soil for grasses of a desirable nature, such as Blue Grass, Red Top, etc.

Will not harm Blue Grass and desirable lawn grasses, in the quantities we recommend.

DIRECTIONS: Mix one (1) pound of Archias' Weed Killer to one gallon water. Sprinkle over 250 sq. ft. of lawn. Use this proportion up until March 15th. After March 15th, sprinkle the above mixture over 600 sq. ft. We recommend 4 to 6 applications in the spring at intervals of about a week apart. It is a gradual program and not an overnight cure. 5 lbs., 45c; 10 lbs., 80c; 25 lbs., \$1.45; 50 lbs., \$2.25; 100 lbs., \$3.50.

Suggestions for Making a Good Lawn

First you must plant good, clean, solid seed, not chaff, weeds or cheap seed. For a good permanent velvety lawn, that you can be proud of, plant Archias' Evergreen Mixture; a mixture of the very best recleaned permanent grasses and White Clover mixed in proper proportions according to our many years of experience in the making of fine lawns.

Seeding may be done to best advantage in the fall or early spring, but grass seed can be planted with good results at almost any time during the spring or summer months.

When making a new lawn thoroughly pulverize the surface about two inches deep. Work in some good fertilizer such as a mixture of pulverized sheep manure and Vigoro. Then, for best results, plant Archias' Evergreen Mixture, 1 pound to every 200 square feet, rake seed in thoroughly, keep well watered until seeds germinate.

Renewing Old Lawns

A lawn can be kept thick and flourishing if at intervals the soil is stirred with a sharp rake and more seeds sown. This should be done just after the grass has been cut, or during a rainy spell. If rolled immediately after sowing, the seeds will be better covered. Every spring and fall fresh seeds should be sown over the lawn to fill in bare spots and thicken the growth. It pays to top-dress your lawn twice a year with a good fertilizer before re-seeding. Use Archias' Lawn Lime on sour soil.

This garden, like millions of others, is fed regularly with Vigoro, the complete plant food made by Swift & Co. Vigoro contains all eleven of the elements plants need for proper nourishment. That's why they develop extensive roots as well as luxuriant foliage and blossoms.

Archias' Northern Grown Alfalfa or Lucerne

(Medicago Sativa)

"There is no state in the Union in which Alfalfa cannot be successfully grown."

Alfalfa produces 3 to 7 tons of hay to the acre.

"Its long, branching roots penetrate far down, and thus constitute a gigantic subsoiler. These become an immense magazine of fertility. As soon as cut they begin to decay and liberate the vast reservoir of fertilizing matter below the plow, to be drawn upon by other crops for years to come."

Prepare the land thoroughly and sow seed at the rate of 15 to 20 pounds per acre, with a broadcaster or grass seeder. Cover with a brush or light harrow. Young plants are quite tender, and the land must be free from weeds until they become established.

Lespedeza

Reseeds itself each year, unexcelled for pasture, hay or soil building. It is drought-resistant. Height, 15 to 24 inches. 10 pounds per acre will produce a heavy crop of hay the second year, but 15 to 20 pounds will secure a full crop of seed for harvest the first year. Our stock is of the highest quality and will give satisfaction. Price of Genuine Mammoth Korean Lespedeza, 1 lb., 20c; 6 lbs., 90c, postpaid. Write for prices on larger quantities.

LESPEDEZA SERICEA. A new perennial Lespedeza introduced by the U. S. Dept. of Agriculture. It is an oriental perennial legume which grows on poor land and acid or sour soil as well as on rich soil. After established, is a great drought resister with an enormous root system. It enriches the soil, lives through the winter, starts growth early in the spring and gives at least 3 cuttings a season with as high as 3 tons of hay per acre from a single cutting. Plant very shallow in 3 1/2-ft. rows on a well prepared bed, in late spring, 3 to 4 lbs. per acre. Cultivate shallow to keep weeds down. Price, 1/4 lb., 20c; lb., 45c, postpaid.
